

C1: Study Notes Discussion 1: Sequence and Data

Name: Alston Liow Guan You

Student ID: 37440985

Date: 23 August 2026

Overview

Writing by hand has been shown to enhance brain connectivity associated with learning and memory formation. This task focuses on you utilising this within your studies for this unit by developing your own handwritten programming study notes.

Do the following:

- Obtain the following items:
 - 1 paper workbook (like shown to the right →)
 - Writing tools: pencils/pens/highlighters etc.
- Write your name and ID on the front page of your workbook (feel free to be creative with the cover!)
- If you can, print the checklist from the end of this document and paste it into the first pages of your workbook. Use this to tick off concepts you have covered as you go.
- As you progress through related Pass tasks, keep referring back to this task and update your workbook with notes and visualisations that help you develop and communicate your understanding of the associated programming concepts.
- Update the checklist below as you progress.
- Move on to Reflect when you have completed all of the concepts from the checklist.

Be creative

The checklist will indicate what you need to show. As long as what you present includes the different aspects indicated, the format is really up to you. This is mostly for **you**, so do what makes sense to you! If we don't get it, it will make for some interesting discussions...which should have positive benefits in themselves.

Reflect:

- What is the most important thing you learned from this and why?

> I need to using hand writing to finish this note. This make me can rearrange my knowledge with write it out. I can conclude the thing I had learned, review it and express it more details and deep.

- What strategies are you applying to ensure that you can use these terms and concepts easily in conversation and discussions around programming?

> I using mind map which is the way I like to do a note clearly. I will ask myself why this will work, how this work? So I can understanding some concept more deeply. When anything unsure, I will go ahead using programming to prove it or find the mistake. This can make me have more experience, not just memory it.

- Why is understanding this terminology important for anyone working in the computing area?

> First, when we reading some reference website, article or book, we need to know this terminology to understand the content. When we are engage some competition or working, we need t communicate with teammate and colleague with using correct terminology.

Disclose:

- Explain your use of Generative AI for this task. If you didn't use it, just write "I did not use any AI for this task". If you did use it, please state which AI model you used (e.g. ChatGPT) and how.

> I did not use any AI for this task

Submit:

- Export this worksheet as a PDF.
- Take a photograph of two pages from your study notes: one that is representative of your work in general, and one that you are particularly proud of or feel was particularly influential in your learning.
- Upload your submission to OnTrack:
 - Mark the task as **Ready for Feedback** in OnTrack and upload the required files.
- Engage with feedback and discussion to get this signed off:

Checklist:

- Notes on building a program (1 page) - include something on:
 - Compiler
 - Program
 - Source Code
 - Command line instructions needed to build and run a program
- Mind map connecting the following terms (1 page):
 - Program
 - Sequence
 - Statement
 - Expression
 - Procedure
 - Procedure Call
 - Function
 - Function Call
- Mind map connecting the following terms (1 page):
 - Variable
 - Variable Declaration
 - Data Type
 - Assignment Statement
 - Expression
 - Argument
 - Procedure / Function Call
- Procedure construct (1 page), showing:
 - Visualisation, metaphor, or illustration showing how you “see” these
 - Connect with related concepts:
 - Identifier
 - Argument
 - Procedure call
 - Statement
 - Example procedures you have used
- Procedure Call action (1 page), showing:
 - Syntax (in an abstract sense - e.g., `identifier ( argument, ... );`)
 - Annotated examples of procedure calls
 - Details of the steps taken by the computer to perform a procedure call
 - A metaphor or illustration you connect with this action
- Function construct (1 page), showing:
 - Visualisation, metaphor, or illustration showing how you “see” these
 - Connect with related concepts:
 - Identifier
 - Argument
 - Function call
 - Expression
 - Example functions you have used
- Function Call action (1 page), showing:
 - Syntax (abstract)

- Annotated examples of function calls
- Details of steps taken by the computer to perform a function call
- A metaphor or illustration you connect with this action
- Variable construct (1 page), showing:
 - Visualisation, metaphor, or illustration showing how you “see” these
 - Connect with related concepts:
 - Identifier
 - Data Type
 - Expression
 - Assignment Statement
 - Syntax for variable declaration/creation
 - Annotated example variable declarations
 - Annotated example variable usage
- Assignment Statement action (1 page), showing:
 - Syntax (abstract)
 - Annotated example assignment statements
 - Details of steps taken by the computer to perform an assignment
 - A metaphor or illustration you connect with this action

- Data type construct (1 page), showing:
 - Visualisation, metaphor, or illustration showing how you “see” these
 - Connect with related concepts:
 - Values
 - Variables
 - Arguments
 - Expressions
 - Example data types you have used, and what they look like in memory
 - String
 - Integer
 - Double
